Dear Sir or Madam:

I recently saw a story on KSL 5 that says Utah is getting a new area code (385). I understand the growth of the city and plenty of new cell phones justifies the need for a new area code.

What I can't understand is why 385 will not have any geographical boundary. May I respectfully ask what the point of an area code would be then? How will I know if the number is long distance or not? How will I know if it's somebody in St. George, or two blocks from my home?

As a Provo resident, I respectfully would like to say that I would much rather change over to a 385 area code with my existing number than have the permanent mystery of where a 385 call is from, or the permanent hassle of having to dial 10 (or is it 11?) digits.

While I can't speak for any other Utah residents, I personally feel a good portion may feel the same way I do.

Sincerely,

Rob Sanders
Provo
